LAB 07

      I thought that IBCM was relatively easy to learn. I really enjoyed playing around with the simulator and editing the code real time (as opposed to editing the file, uploading it into the simulator, and ect). The only TEDIOUS part of writing IBCM code was that each line had to have its own memory address. When writing or editing the IBCM, I had to go through each line of memory and change the address if there was a previous alteration before. But overall I thought that IBCM was "easy" to understand. If I had more practice I feel that I could be more adept at quickly thinking it through and writing the code. A modification to the similar would be to adjust the different lines when a previous line is changed above. This would make it easier because the code would not have to hard code every single memory address after. At this moment, I do not feel confident in writing IBCM code but with time and practice I think I would be able to.
